NINO - Complete Project Brief for Replit

One World, One Voice

Upload this brief to Replit together with the Nino reference images. It is written as a direct build specification for the development agent.

1. Project Vision

Build a mobile-first global social platform called Nino. Nino connects people from different countries who speak different languages. The core experience is real-time communication with translation, so each person can speak naturally in their own language while the other person can understand them in their preferred language.

The product should feel simple, modern, social, fast, and international. The first version should be a functional MVP that can be expanded later without rebuilding the entire architecture.

2. Core Product Idea

Nino combines short-form social video, live streaming, multilingual chat, and translated conversations. The main differentiator is translation. Translation should not feel like a separate utility; it should be integrated directly into videos, live rooms, messages, and conversations.

For the MVP, text translation can be implemented first where necessary, while the code and interface must be prepared for real-time speech-to-speech translation in a later phase.

3. Brand and Visual Direction

App name: Nino
Slogan: One World, One Voice
Brand direction: youthful, global, friendly, premium but simple.
Primary visual idea: a strong capital N, globe/world elements, and a turquoise-based identity inspired by the supplied Nino reference images.
The supplied images are design references. Use them to understand the intended feeling and direction, but create a consistent production-ready UI rather than simply copying screenshots.

4. First-Time User Flow

Create the onboarding flow in this order:
1. Splash screen with the Nino logo and slogan.
2. Language selection. Start with Arabic, English, Portuguese, and Spanish, with architecture that allows more languages later.
3. Sign up / Log in.
4. Basic profile setup: display name, country, native language, languages the user wants to understand, profile photo.
5. Enter the main Nino home feed.

Arabic must support RTL correctly. English, Portuguese, Spanish, and other Latin languages must support LTR correctly.

5. Main Home Feed

The main screen should be a vertical short-video feed designed for mobile. Users swipe up and down between videos.

Each video should support:
- Creator profile
- Follow button
- Like
- Comment
- Share
- Caption
- Language indicator
- A clear 'Translate with Nino' control
- Translated subtitles when translation is active

The feed should be designed so future recommendation algorithms can be added later.

6. Nino Translation Experience

Translation is the most important feature in the product.

MVP requirements:
- Translate video captions/subtitles.
- Translate text chat messages.
- Let each user choose the language in which they want to receive translations.
- Show original text and translated text in a clean, non-confusing way.
- Structure the backend so speech recognition, machine translation, text-to-speech, and real-time voice translation services can be connected later.

Future target experience:
Person A speaks Arabic. Person B chooses Portuguese. Person B hears or sees the meaning in Portuguese. Person B answers in Portuguese, and Person A receives Arabic. The interface should make this feel like a normal conversation, not a technical translation workflow.

7. Live and 'Live Together'

Create a Live section with two concepts:
A. Standard Live: one creator broadcasts to viewers.
B. Live Together: 2 to 4 participants from different countries can join the same live room.

For Live Together:
- Show each participant clearly.
- Display each participant's country/language.
- Allow translated captions for participants and viewers.
- Prepare the architecture for translated voice in a later phase.
- Viewers can comment, react, and follow.
- Viewer comments should be translatable.

The UI must remain understandable even when several languages are being used at the same time.

8. Messaging

Create direct messaging with:
- Conversation list
- One-to-one chat
- Text messages
- One-tap or automatic translation
- Original/translated message view

- Profile and language information
- Architecture ready for voice messages and translated voice messages later

Do not hard-code the product to only the initial languages.

9. Profiles, Countries and Rewards

User profiles should contain:
- Profile image
- Display name / username
- Country
- Native language
- Followers / following
- Videos
- Nino achievements

Create a simple country-based achievement system. Examples:
- Connected with people from 10 countries
- Connected with people from 20 countries
- Connected with people from 30 countries

This system should later support badges, challenges, levels, and rewards.

10. Challenges and Social Retention

Prepare a Challenges area for future expansion. Nino can propose social challenges between users or live participants. A challenge may have a playful task for the loser or a completion reward.

For the first version, build the UI and data model for challenges without creating a complicated game engine. The goal is to make Nino social and entertaining, not only a translation application.

11. Navigation

Use a simple mobile bottom navigation. Suggested tabs:
- Home
- Explore / World
- Create
- Live
- Profile

Messaging and notifications can be accessible from the top area or dedicated icons. Keep navigation simple enough for a first-time user to understand immediately.

12. Technical Requirements for the MVP

Build a working, organized prototype/MVP rather than static mockups.

Requirements:
- Mobile-first responsive design.
- Reusable components.
- Clean project structure.
- Authentication.
- User profiles.
- Video feed using sample/demo content where needed.

- Live room UI/prototype.
- Messaging UI and basic data flow.
- Translation abstraction/service layer so a translation provider can be connected or changed later.
- Database schema for users, profiles, videos, follows, likes, comments, messages, live rooms, languages, translations, achievements, and challenges.
- Secure handling of secrets/API keys through environment variables.
- Loading states, empty states, and useful error states.
- RTL/LTR support.
- Do not expose API keys in frontend code.
- Add a clear README with setup and run instructions.

13. Development Priorities

Build in phases and keep the app runnable after each phase.

Phase 1: Project structure, brand system, splash screen, language selection, authentication, and profile setup.
Phase 2: Main short-video feed and core social interactions.
Phase 3: Translation for text/captions and language preferences.
Phase 4: Messaging.
Phase 5: Live and Live Together UI/prototype.
Phase 6: Profiles, country achievements, and challenge foundations.
Phase 7: Polish, testing, error handling, and deployment preparation.

Do not attempt an expensive full speech-to-speech translation system before the basic product works. However, design interfaces and services so that capability can be added without redesigning the entire application.

14. Important Instruction to Replit

Before writing a large amount of code, first produce:
1. A short architecture plan.
2. The proposed technology stack and why it fits this MVP.
3. The database/data model.
4. The screen list and navigation map.
5. A file/folder structure.
6. Which features will be functional in the first build and which will be mocked.
7. Any API/service that would create recurring costs.

Then begin implementation in small working milestones. After each milestone, keep the project runnable and do not remove previously working features without explaining why.

15. Definition of a Successful First Build

The first build is successful when a new user can open Nino, select a language, create an account, create a basic profile, enter a convincing short-video feed, see the Nino translation control, open translated text/captions, access messages, open the Live/Live Together experience, and view a profile with country-based achievements.

The MVP does not need to perfectly reproduce TikTok, Instagram, or a production-grade global translation network. It must clearly demonstrate Nino's unique product idea and provide a solid technical foundation for later real-time voice translation.

16. Reference Images

Use the attached Nino images as visual references for the logo, onboarding, global identity, and translation experience. Preserve the core Nino identity: global connection, language accessibility, turquoise visual direction, and the slogan 'One World, One Voice'.
